

PDFPoint lets you build PDFs quickly and easily because of the following reasons:

- **Objects:** Each element of the page is a separate object and has its own set of properties, such as font, colour etc.
- **Stencils:** Objects are created from *stencils*, which act as templates and let you build consistent documents.
- **Dropper tool:** With this tool you can take the properties from one object and apply them directly to another object, making retrospective changes easy.

Some more of the great features that make *PDFPoint* so easy to use:

- **WYSIWYG editor:** The *PDFPoint* editor shows you what the presentation will look like in its final PDF format. And if that's not enough, you can use your PDF viewer as a preview by running it whenever you export the document.
- **Master pages:** Master pages act as watermarks, putting certain elements (such as a logo or boundary rules) onto every page that needs them.
- **Multiple master pages:** Split your presentation into sections with different layouts by having more than one master page within the document. Certain pages can also be set not to use the master page, for an intermission slide or just something different.

Not only does *PDFPoint* let you produce elegant textual presentations, but it can also produce professional looking diagrams in PDF output:

That's the end of this short presentation. If you want to know more about *PDFPoint* or any other **red corona** software please email me at:
